Town of River Bend  
Attn: Delane Jackson, Town Manager  
45 Shoreline Dr.  
New Bern, NC 28562

Mr. Jackson,

It has been a pleasure to walk Plantation Dr and Anchor Way and evaluate the trees located in the median. I have taken an inventory which will give us a record of the conditions of the trees and any work that may need to be done. Some of the tasks include pruning, training, mulching, cabling, and of course removals. Some of the work is mainly for aesthetics and some are for safety. I will try to elaborate on that in this report.

The good news is there are very few issues that are of immediate safety concern. There is some street lighting conflicts, plenty of deadwood that should be pruned, and areas where pedestrians have no where to go when they encounter vehicles. Most of the mature pine trees have several dead limbs that need to be pruned. Some of these limbs have already fallen and are of a size that could cause injury to people and damage to vehicles. Some of the larger oaks also have dead limbs that should be pruned as well as a large broken limb hanging in Tree #16 that could fall at any point. This should be removed as soon as possible. Root space is definitely an issue as well. Many of the mature trees have little to no room for continued root growth. Some trees have run out of room for their Critical Root Zone. These should be discussed as to their removal. Others have no room for their Root Plate. These should be removed.

Another issue and quite possibly the biggest issue you'll face is the improper pruning that has been done. This is mostly in the Crape Myrtles and unfortunately may continue if homeowners are allowed to prune the trees; this is assuming homeowners are the ones conducting this improper pruning and not a hired company. Many of the Crape Myrtles have been topped over the years. I'm sure this was in an attempt to keep them small but unfortunately when trees are topped they tend to resprout, with multiple stems, which compete against one another, and you end up with a less desirable specimen with long spindly limbs that are not as strong and weakly attached. It also appears that many of the Crape Myrtles planted were possibly of the dwarf or miniature variety. While this limits their height it doesn't necessarily limit their width. Couple this with the fact that most of them are multi stemmed plants has resulted in many of their limbs extending into or very close to the road. This doesn't leave much room for cars to get around pedestrians. This could possibly be corrected by replacing dwarf multistemmed plants with varieties that will reach a taller height. This may seem like a bad idea but the thought would be to put the canopy above vehicles and pedestrians both limiting contact and creating a much more aesthetically pleasing median. Keep in mind that to accomplish this may require the

purchase and planting of larger plants initially. Proper instruction or possibly rules, assuming there are none, regarding pruning may be needed to ensure the proper growth of any species that gets planted in the median.

This leads to me to speak more to aesthetics. If the goal of this report was to just report on the safety of median trees at River Bend it would be a short report. With the goal being the safety, attractiveness, and sustainability of the median we must speak to the attractiveness. Unfortunately there is a lot of judgement here. What one person likes a neighbor may dislike. My goal is to point out possible changes that may be more aesthetically pleasing. This is by no means a recommendation to make major changes immediately, this is to give CAC some more information to discuss with changes that could be made over time. I'll try to put some priority to these ideas.

The first priority goes to invasive species. Plants like Nandina and Privet are found along the median. While these 2 species are most likely not a huge problem in River Bend I still cannot recommend these as desirable species. They don't necessarily offer much as far as aesthetics and there are certainly more desirable species that could replace them. There are many Nandinas throughout the median.

Next we have plants that at one time were desirable but like the Crape Myrtles have been poorly pruned or not pruned regularly and now are overgrown with little ability to prune to a pleasing shape, they are just too far gone. Several Chinese Holly in this condition. Chinese Holly can be maintained to keep a pleasant shape but this requires routine pruning and they can get out of hand quickly. Euonymus is another. There are only a few of these but again are in poor shape with little chance of being maintained. Keep in mind this includes some of my opinion and judgment as stated previously.

Then we have small species that don't really add any benefit to the median, Gardenia, Yucca, Pampas Grass, and Azalea. Again my opinion on some of this, most of the Gardenias are very small and close to the ground which is nice but as you drive by or even walk you don't really get to enjoy them. These may be dwarf varieties that were planted. Yuccas can be painful if you bump into one. They don't offer aesthetics and can multiply and become a nuisance. Pampas grass is nice to look at when left alone to grown fully but like other species mentioned they get cut leaving a less desirable tuft of grass. Azaleas are lovely and I think many could be left alone to continue growing in the median. There are some Azaleas that are in worse shape than others, some have small trees growing within them that should be removed and some are growing under and close to trees which creates a wall of vegetation along the median. Not only does this leave no where for pedestrians to retreat from oncoming traffic but some homeowners wished they could see through more easily to talk with their neighbors across the street or as they walk by. These are my concerns with aesthetics.

Lastly I want to mention Species Diversity. While there are many different species along the median, there are several places where the same species is planted back to back multiple times. Such is the case with trees 31-44 and again with 50-59 and again along Anchor Way. The good news is these trees are Crape Myrtles which don't normally have major pest or disease problems. However if a disease, fungus, pest or pathogen did come around affecting Crape Myrtles you could have some large areas with no vegetation or seriously declining plants. There are other spots along the median with dogwoods as well. In the future I recommend a little more species diversity. Not only will this be beneficial in the event of a disease/pest outbreak, it also adds greatly to the beauty of the median.

In summary I'd like to make my recommendations. I will use tree numbers at times if it is a specific tree in need of work. I will also put these in priority with the first being my most concerning and lastly listing things for future discussion.

Any dead limbs should be pruned before they fall on someone, especially in tree 16 which has a large dead hanging limb and tree 121 which has large deadwood. There are several Oak Trees (Tree #s 14 and 15) that are conflicting with street lighting and should be removed. This will also allow more room for a large mature Oak to continue to grow. Also tree 72 which is a Crape Myrtle, tree 121 which is a Willow Oak and mentioned previously, and tree 222 which is a Cherry Laurel are all conflicting with street lighting. They should be pruned or removed if necessary to prevent light obstruction. These issues are the most concerning with regard to safety. Also it would be wise to consider opening up space by removing some plants to allow pedestrians to move into the median if necessary to avoid traffic.

Next we need to consider the Root Plate Zone and Critical Root Zone. Any tree with pavement over the Root Plate Zone should be removed. Trees # 48, 197, and 199 have measurements within the Critical Root Zone and very close to the Root Plate Zone. These should be considered for removal at some point. Most other mature trees also have measurements to pavement within the Critical Root Zone. Trees within the Critical Root Zone should be considered for removal but this could be less of a priority and could be spaced out over time. There is no way to guarantee they will stand up in a strong wind event. There is probably ample soil volume to allow for continued growth but the available space for structural roots will be compromised by pavement.

Any invasive species such as Nandina and Privet should be removed and replaced with a more desirable, appropriate, and non-invasive species. Many options are available and I will have a recommendation list later in the report.

Also many of the dwarf Crape Myrtles should be considered for removal. I realize this will be quite an expense so I recommend replacing them over time with more desirable plants. These replacements can be other Crape Myrtles but considerations must be made for immediate, short and long term growth when selecting a plant. Single stem plants should be first choice.

Considering plants that have become overgrown, for example most of the Chinese Hollies, some of the Azaleas, and Euonymus could be pruned to try and regain control and maintain shape but this may not work and will be an eyesore for some time. This is another issue that could be taken care of over time when budgets allow and or other work is being done in the area.

Lastly I would keep in mind species diversity. As old plants are removed and new plants are installed try and mix different species along the median. This makes for better aesthetics as well as preventing total losses in the event of a pest or disease outbreak.

There are various notes in the tree inventory itself for consideration and I highly recommend this type of inventory or at least frequent assessments of all mature trees be conducted routinely.

Let me know if you have any questions or if I can be of further assistance.
